Abstract

This report presents a comparative analysis of the social media response to the film *Materialists* relative to four concurrent releases: *How To Train Your Dragon*, *Lilo & Stitch*, *Mission: Impossible - The Final Reckoning*, and *F1: The Movie*. Using a dataset of 500 Reddit posts, we identified key topics of discussion through open coding. Our findings indicate that while *Materialists* receives equal coverage volume in our controlled sample, the nature of its discourse is distinct: it is driven primarily by cast and production details rather than the box office speculation that dominates its franchise competitors.

Introduction

In the crowded landscape of summer movie releases, understanding audience sentiment is crucial for distributors and marketing teams. Our team has been hired by a media company to evaluate the social media landscape surrounding the release of *Materialists*, an A24 production released alongside major franchise blockbusters. The client is specifically concerned with two key metrics:

- Topical Focus:** What aspects of the movie are the focus of public discussion? Is it the plot, the actors, the box office numbers, or the marketing?
- Comparative Positioning:** How does the coverage and reception compare to other major films released in a similar window?

To answer these questions, we conducted a rigorous analysis of 500 Reddit posts across five movies. We compared *Materialists* against four high-profile competitors: *How To Train Your Dragon*, *Lilo & Stitch*, *Mission: Impossible - The Final Reckoning*, and *F1: The Movie*. We decided to compare *Materialists* against the top 4 summer blockbusters (Box Office Mojo 2025). By allocating exactly 100 posts per movie, we ensured that the analysis for each individual film was extensive and balanced. This report details our coding methodology, quantitative topic distribution, and a qualitative characterization of the discourse using TF-IDF analysis and Large Language Model (LLM) summarization. By identifying the main topics for each film, we provide actionable

insights into how *Materialists* is carving out its niche in a market dominated by sequels and remakes.

Data

Data Collection

Our dataset consists of 500 posts collected from Reddit, a platform chosen for its depth of textual discussion and community-driven aggregation. Reddit fosters threaded discussions, making it ideal for topical analysis.

The data collection process was designed to be strictly unbiased regarding coverage volume. A simple random sample of all movie discussions would likely be overwhelmed by the most popular films. To ensure we could adequately analyze the discourse for *Materialists*, we employed a stratified sampling strategy, collecting exactly 100 posts for each of the five movies. This balanced distribution is shown in Figure 1, which displays the 20% per movie allocation after excluding unrelated posts labeled as "no movie."

Figure 1: Distribution of Posts by Movie (Balanced Sampling)

Figure 1: Distribution of Posts by Movie. The sampling was strictly balanced (20% per movie) to ensure fair comparison.

- *Materialists* (Focal Movie)
- *How To Train Your Dragon* (Live-action remake)
- *Lilo & Stitch* (Live-action remake)
- *Mission: Impossible - The Final Reckoning* (Franchise sequel)
- *F1: The Movie* (Sports drama/Blockbuster)

We employed a multi-stage data collection pipeline. First, we scraped every post from 10 different movie subreddits between April 1st and September 1st: *r/boxoffice*, *r/cinema*, *r/entertainment*, *r/fauxmoi*, *r/film*, *r/flicks*, *r/letterboxd*, *r/moviecritic*, *r/movies*, and *r/popculturechat*. From this initial corpus of over 100,000 posts, we applied a series of filters to ensure data quality and relevance:

- **Keyword Filtering:** We filtered posts to only include those containing movie title keywords in the post title. Our keyword list included the full movie titles and common abbreviations: “Materialists,” “How To Train Your Dragon,” “HTTYD,” “F1,” “F1: The Movie,” “Mission: Impossible - The Final Reckoning,” “Mission Impossible,” “MI8,” “Lilo & Stitch,” and “Lilo and Stitch.” Initially, we included actor names in our keyword list, but we removed them after discovering that posts matching actor names were often celebrity gossip rather than movie-related content. By restricting keywords to movie titles only, we ensured that any post mentioning a movie would necessarily include the movie name, improving precision.
- **Duplicate Removal:** We removed any duplicate entries both by post title and article link (where applicable) to prevent double-counting the same content across different subreddits.
- **English Filtering:** We restricted posts to English using Reddit’s language metadata and manual spot checks to ensure all sampled content was English only.

After applying these filters, we obtained approximately 2,221 posts total. Table 1 shows the natural distribution of posts across the five movies in this original dataset, revealing significant imbalance in coverage.

Movie	Posts	Percentage
F1: The Movie	778	35.03%
Lilo & Stitch	457	20.58%
Mission: Impossible - Final Reckoning	431	19.41%
How To Train Your Dragon	372	16.75%
Materialists	183	8.24%

Table 1: Natural Coverage Distribution in Original Dataset (2,221 posts)

As shown in Table 1, *F1: The Movie* dominated with over one-third of all posts (35.03%), while *Materialists* received the least coverage at only 8.24%. We initially randomly sampled 500 posts from this pool to reduce the dataset size. However, analysis of this random sample revealed significant imbalance: only 35 out of 500 posts were related to *Materialists*, with *Mission: Impossible* and *F1: The Movie*

dominating the dataset. To ensure fair comparative analysis, we returned to the full 2,221-post pool and implemented stratified random sampling, randomly selecting exactly 100 qualified posts for each of the five movies, resulting in 500 posts total. This approach ensured that our final dataset was unbiased by collection timing, subreddit popularity, or transient algorithmic spikes, providing a robust and representative baseline for comparative analysis.

Methods

Data Annotation

To develop our typology, we employed an inductive coding approach. This methodological framework was chosen because it allows categories to emerge directly from the data rather than imposing a pre-existing, potentially biased schema.

1. **Open Coding:** We initially selected a random subset of 200 posts (40 from each movie) to serve as our training set. One team member reviewed these posts, generating free-form descriptive labels for the primary topic of each. For example, the annotator labeled a post “audience score, positive reception, early reception” while another was labeled “domestic box office tracking, theatre count, revenue figures.” This phase prioritized capturing the full diversity of the discourse without constraint.
2. **Axial Coding:** Three team members then convened to group these initial labels into broader categories (Axial Codes). The disparate labels mentioned above were merged into the single category **Opinion and Review**. Similarly, distinct posts about “trailers,” “posters,” and “interviews” were analyzed to see if they belonged together. We ultimately separated “Promotional Material” (official assets) from “Cast and Production” (interviews/news) to capture the nuance of the *Materialists* campaign. This process resulted in 7 mutually exclusive categories that comprehensively covered the dataset.
3. **Annotation:** Using this finalized codebook, the three team members manually annotated the remaining 300 posts and reviewed the initial 200 to ensure consistency. Each post was assigned exactly one topic based on its title and body text. Inter-annotator agreement was informally monitored during the synthesis phase to resolve ambiguous cases (e.g., a post containing both a review and a box office prediction was coded based on its primary focus).

Data Analysis

To characterize the topics beyond subjective manual labeling, we performed two computational analyses:

TF-IDF Analysis: We computed the Term Frequency-Inverse Document Frequency (TF-IDF) scores for words within each category. This statistical measure evaluates how important a word is to a document in a collection or corpus. To obtain these scores, we followed a four-step procedure:

1. We concatenated all post titles belonging to a specific category (e.g., “Box Office”) into a single “document”.

2. We standardized the text by removing non-alphabetic characters and converting everything to lowercase.
3. We calculated the TF-IDF scores using the `TfidfVectorizer` from the `scikit-learn` library, applying a standard English stop-word list to remove common noise words.
4. For each category, we extracted the top 10 terms with the highest TF-IDF scores to identify the "signature" vocabulary of that topic.

This method effectively filtered out common stopwords like "the" or generic terms like "movie" that appear with equal frequency across all topics, isolating the unique lexicon of each category.

LLM Summarization: We used ChatGPT to generate representative summaries by feeding it our annotated csv file. To ensure consistency, we used a standardized prompt: *"Please provide a representative summary of the following social media posts regarding the topic [Topic Name]. Highlight the main sentiments, recurring themes, and specific details mentioned."* This qualitative step provides narrative context to the quantitative TF-IDF results.

Results

Typology Definitions

The inductive coding process resulted in the following seven mutually exclusive categories:

- **Opinion and Review:** Critic opinion, audience reviews, metrics (Rotten Tomatoes/CinemaScore), and early reactions.
- **Box Office and Business Performance:** Financial tracking, theater counts, and revenue predictions.
- **Cast, Production, and Behind-the-Scenes:** Casting news, director interviews, filming updates, and on-set photos.
- **Distribution and Release:** Streaming dates, VOD releases, and theater expansions.
- **Promotional Material:** Trailers, posters, TV spots, and official marketing.
- **Community Engagement and Fan Interaction:** Fan theories, "What if" questions, polls, and general discussion.
- **No Movie:** Unrelated posts (excluded from analysis).

Annotation Results

Across the entire dataset of 500 posts, the conversation was heavily skewed towards business and logistics rather than creative content. As shown in Figure 2, nearly half of all discussions (46%) focused on **Box Office** performance.

This dominance suggests that for major releases, the film's financial success often overshadows discussion of the film itself. **Community Engagement** (19%) and **Opinion** (16%) were the secondary drivers of conversation.

Figure 2: Aggregate Topic Distribution (All Movies)

Figure 2: Aggregate Topic Distribution. Box Office reporting dominates the overall discourse, representing nearly half of the dataset.

Qualitative Analysis: Topic Characterization

Table 2 presents the top 10 TF-IDF words and a representative summary for the major categories. Below, we provide a detailed breakdown of the discourse within these key topics using specific examples from our dataset.

Box Office and Business Performance The vocabulary in this category is highly technical and numeric ("grossed," "estimated," "weekend"). The LLM summary highlights that the discourse is highly comparative, constantly measuring films against each other. For *How To Train Your Dragon*, the sentiment is generally positive regarding its global "legs," with specific milestones like crossing \$250M domestic being celebrated. However, comparative analysis frames it as underperforming relative to *Lilo & Stitch*, which is described as a "huge box office winner." Specific details often include granular tracking of international markets. For instance, one post notes: "In China *How to Train Your Dragon* powered by strong walkups hits a \$2.33M opening day. Above *Lilo & Stitch*(\$2.03M)." This confirms that for franchise films, the main topic is almost entirely numerical. Users act as amateur financial analysts, debating "multipliers" and "drop-offs" rather than plot points.

Opinion and Review This category reveals a sharp divergence in sentiment. *How To Train Your Dragon* (2025) received surprisingly positive feedback, with users calling it "really good" and "the best live action remake." This contradicts the common skepticism surrounding remakes. In contrast, *Lilo & Stitch* faced mixed reactions, with some users expressing "strong backlash" regarding cultural representation. For *Materialists*, the opinions are substantive and criti-

Topic	Top 10 TF-IDF Words	Representative Summary
Box Office	weekend, estimated, total, opening, stands, box, office, grossed, gross, lilo	Focuses on financial tracking, specifically domestic and international box office gross, opening weekend estimates, and theater counts.
Community Engagement	mission, impossible, movie, reckoning, materialists, train, dragon, stitch, final, lilo	Captures fan excitement, theories, and questions, particularly regarding franchise continuity and future installments.
Opinion and Review	impossible, mission, opinion, materialists, review, action, live, reckoning, final, train	Contains subjective quality assessments, debating the quality of action sequences, acting performances, and comparisons to original material.
Cast and Production	celine, director, song, stitch, lilo, materialists, movie, joseph, actor, action	Highlights specific actors (e.g., Celine Dion) and director interviews, focusing on the creative process.
Promotional Material	trailer, pascal, pedro, materialists, new, chris, dakota, johnson, evans, official	Tracks the release of marketing assets like trailers, posters, and casting reveals.
Distribution and Release	watch, impossible, train, dragon, mission, digital, happening, lilo, stitch, liveaction	Discusses streaming release dates (Disney+), VOD availability, and theater expansion updates.

Table 2: Characterization of Key Topics

cal, focusing on character depth rather than technical execution. One user asks:

”Question for those who saw *Materialists*: Are Chris Evans and Pedro Pascal realized characters or just narrative devices?”

This contrasts sharply with the franchise discourse. A *Mission: Impossible* post reads: ”Rewatching Mission Impossible 2, Holy F* it is worse than I remember.” The TF-IDF words ”ranking” and ”comparison” were prominent here, highlighting how franchise films are evaluated against their predecessors, whereas *Materialists* is evaluated as a standalone work of art.

Cast, Production, and Behind-the-Scenes This topic was the defining feature of our focal movie, *Materialists*. The discourse is characterized by a ”respectful interest” in the creators. Celine Song’s directorial approach is a major recurring theme, with users discussing her ”thoughtful approach to storytelling” and influences from Nora Ephron. This angle is unique to *Materialists* in our dataset. For the other films, this category focused on stunts (Tom Cruise in *Mission: Impossible*) or controversy (Nico Parker’s casting in *HTTYD*). The high frequency of proper names (Dakota, Pedro, Chris) in the *Materialists* data confirms that the ”star power” is the primary hook. Posts often feature red carpet photos or press tour clips, functioning as a digital magazine spread rather than a traditional movie discussion.

Community Engagement and Fan Interaction This category captures the pulse of the fandom. *Mission: Impossible* dominates here with intense ranking debates and continuity questions (”Do I need to watch Dead Reckoning first?”). *Lilo & Stitch* engagement is more contentious, with debates about AI generated reviews on IMDb and comparisons to *Minecraft* for the top domestic film spot. *Materialists* has a quieter, more inquisitive form of engagement. Users ask for thoughts on the chemistry between leads, signaling a desire

for qualitative discussion rather than the quantitative ranking seen in franchise threads.

Promotional Material This category tracked the release of trailers and merchandise. For *Lilo & Stitch*, interest spiked around ”novelty popcorn buckets” at theater chains like AMC and Regal. *Materialists* promotion was distinct: it focused heavily on ”press tours” and ”AMAs” (Ask Me Anything) with the director, reinforcing the personality-driven marketing strategy. *F1: The Movie* relied on high-tech spectacle, with ”haptic trailers” and a Brad Pitt/Tom Cruise crossover narrative driving the promotional buzz.

Distribution and Release This category was informational and forward-looking. The discourse centered heavily on **sequel announcements**, specifically the confirmation of a live-action *How To Train Your Dragon 2* set for 2027. This suggests that for successful remakes, the conversation immediately pivots to franchise longevity. For *Mission: Impossible*, the focus was on ”digital access,” with fans tracking VOD dates and debating the merits of ”IMAX” vs. standard formats. Unlike the other categories which were opinion-heavy, this topic functioned as a utility service for fans, answering the practical questions of ”when” and ”how” to watch.

Per-Movie Analysis: Materialists vs. Competitors

A granular analysis reveals that the discourse surrounding *Materialists* is different from its competitors (Figure 3).

Materialists (The Focal Movie) *Materialists* displayed a unique profile compared to the other four films. It had the highest proportion of **Cast, Production, and Behind-the-Scenes** posts (17%) and a high volume of **Opinion and Review** (18%). Unlike the franchise blockbusters, interest in *Materialists* appears to be driven by its talent and qualitative assessment rather than IP lore or box office speculation. It had the second lowest percentage of Box Office posts (39%)

Figure 3: Topic Distribution per Movie. Stacked bar chart showing the percentage of posts in each category for the five movies.

among the group, after *Mission: Impossible* (28%), indicating it is not being judged primarily by its commercial performance.

Competitor Group 1: The Remakes *How To Train Your Dragon* and *Lilo & Stitch* exhibited remarkably similar profiles, both heavily dominated by **Box Office** discussion (59% and 58% respectively). This suggests that for these high-budget remakes, the primary narrative centers on commercial viability. The "Community Engagement" for these films was surprisingly low (11% and 10%), implying that while people are *tracking* the movie's success, they aren't necessarily discussing the content fan-to-fan in the same way they do for original properties or established action franchises.

Competitor Group 2: The Franchises *Mission: Impossible* showed the most balanced profile with the highest **Community Engagement** (32%), reflecting a mature fanbase invested in plot theories ("Could you outrun Ethan Hunt?"). *F1: The Movie* bridged the gap, showing strong **Box Office** interest (47%) but also significant fan interaction (27%), likely due to the overlap between Formula 1 sports fans and moviegoers.

Discussion

The results of our analysis directly address the client's questions about *Materialists* and its position in a crowded summer release window. They show a clear split between the broader franchise driven marketplace and the prestige counter programming niche in which *Materialists* competes.

Relative Coverage Volume

Addressing the client's second question about relative coverage, Table 1 reveals that *Materialists* received significantly less organic coverage than its competitors in the original dataset. Out of 2,221 posts, *Materialists* accounted for only

183 posts (8.24%), ranking last among the five films. In contrast, *F1: The Movie* dominated with 778 posts (35.03%), followed by *Lilo & Stitch* at 20.58% and *Mission: Impossible* at 19.41%. This 4.25:1 ratio between the highest and lowest coverage demonstrates that *Materialists* struggled to generate the same volume of social media discussion as the franchise blockbusters, despite being released in the same window. However, as discussed in our topic analysis, the *nature* of *Materialists*' discourse was qualitatively distinct, focusing on artistic merit rather than commercial performance.

Box Office Discourse as the Dominant Narrative

A key finding of our study is the overwhelming dominance of **Box Office** discussion (46% of all posts). For *How To Train Your Dragon* and *Lilo & Stitch*, over half of all social media "noise" was simply the repetition of revenue figures, theater counts, and "drop-off" percentages. This creates a "Meta-Narrative" where the movie's quality is secondary to its financial health. This phenomenon suggests that for major IP releases, the audience has internalized the studio's perspective. They track the movie's success not by asking "Is it good?" but by asking "Is it profitable?". The high frequency of technical terms like "grossed," "estimated," and "weekend" in our TF-IDF analysis confirms this shift towards amateur financial analysis. For a new IP like *Materialists*, this is a dangerous battlefield. It cannot compete on these metrics because it does not have the massive opening weekends of a Disney remake. However, our results show it successfully side-stepped this entire conversation. By generating significantly less Box Office chatter (only 39% vs 58% for competitors), it allowed space for more substantive discussions about acting and directing.

Materialists: A Personality-Driven Success

The "focus" of the article for *Materialists* is predominantly **Artistic and Talent-Based**. The high frequency of proper names (Dakota, Pedro, Chris, Celine) in the TF-IDF analysis suggests that the marketing strategy of leveraging star power has worked. The audience sees this film as a vehicle for these actors, rather than a brand extension. However, the high volume of "Opinion" posts (18%) is a double-edged sword. Unlike franchise films which have a "floor" of fan engagement regardless of quality (seen in the 32% engagement for *Mission: Impossible*), *Materialists* relies entirely on positive word-of-mouth. The specific Reddit threads debating whether the actors are just "narrative devices" signal that this audience is critical and demanding. They are engaging with the text of the film, not just the event of the release. This means the film's long-term success will likely be driven by critical consensus rather than the "fan loyalty" that protects franchises like *F1* or *Mission: Impossible* from negative reviews.

Comparative Positioning: Remakes vs. Sequels

Our cross-movie comparison highlighted a distinct difference between "Remakes" and "Sequels."

- **The Remakes (HTTYD, Lilo & Stitch):** These films generated high volume but low engagement. People

shared the box office numbers, but they didn't discuss the plot or characters in depth (only 10% Community Engagement). The sentiment analysis showed distinct "backlash" for *Lilo & Stitch* regarding cultural issues, suggesting that visibility does not equal popularity. In contrast, the generally positive reception for *HTTYD* suggests that quality execution can mitigate "remake fatigue," though it still struggles to generate the organic theory-crafting of a sequel.

- **The Sequels (Mission: Impossible):** In contrast, the established franchise generated high "Community Engagement" (32%). Fans were actively debating plot theories and rankings. This suggests that "sequels" retain a loyal community core that "remakes" fail to activate. The audience for *Mission: Impossible* acts as a self-sustaining ecosystem, generating content (rankings, retrospectives) without needing new promotional triggers.

Materialists sits outside both these camps. It lacks the "guaranteed audience" of the sequels but also avoids the "cynical scrutiny" of the remakes. Its position is fragile but high-potential: it is the only film in our dataset being discussed primarily as a work of art.

Platform Dynamics and Genre Impact

It is crucial to acknowledge the role of Reddit's specific ecosystem in shaping these results. The platform's upvote/downvote mechanism rewards substantive, text-heavy content, which naturally favors the detailed "theory-crafting" seen in the *Mission: Impossible* threads and the in-depth "character analysis" for *Materialists*.

- **Genre Bias:** Action franchises like *F1* and *Mission: Impossible* benefit from Reddit's male-skewing demographic, which explains the high engagement with "technical" aspects like stunts and camera work.
- **Rom-Com Resilience:** *Materialists*, a romantic comedy/drama, managed to carve out significant space (100 posts in our balanced sample) despite this demographic headwind. This suggests that the "A24 brand" acts as a genre unto itself, attracting a "cinephile" audience that transcends traditional genre boundaries. The discussion around Celine Song's "feminism and class" themes indicates that Reddit's audience is willing to engage with complex thematic content when it is framed through an "auteur" lens.

Implications for Strategy

Based on these interpretations, we recommend a distinct pivot for the *Materialists* campaign:

- **Prioritize the Director-Driven Brand:** Our data indicates that the audience is highly responsive to director Celine Song's personal insights, particularly in her "Ask Me Anything" (AMA) sessions on Reddit. Marketing should amplify this by centering the campaign on her unique artistic vision, positioning *Materialists* as a prestige, creator-led work distinct from studio-manufactured blockbusters like *F1*.

- **Avoid Box Office Comparisons:** Promoting financial milestones is unlikely to be effective. The discourse on Reddit is dominated by the massive revenue figures of franchise giants, making any "number-one movie" claims for a smaller film ring hollow. Instead of competing on raw volume, the strategy should focus exclusively on critical acclaim and cultural impact.
- **Shift from "Judgment" to "Analysis":** While the film generates plenty of reviews ("Opinion"), it lacks the interactive community speculation ("Fan Interaction") seen in *Mission: Impossible*. To drive sustained engagement, the campaign should release content that invites interpretation, such as clips highlighting ambiguous character motives to encourage fans to theorize and debate the plot rather than just rating the film.

Biases and Limitations

We must also acknowledge potential methodological biases. Our stratified sampling approach ensures exactly 100 posts per movie. While ensuring that all movies' coverage was analyzed equally, it does not reflect the relative coverage. For instance, *Materialists* may have received significantly less coverage than *F1: The Movie* in reality, but our balanced sampling gives equal weight to both films' discussions. This approach was necessary to enable fair comparative analysis, but it means our results reflect the *nature* of discourse for each film rather than how much coverage the movie got relative to others.

Our study also faces methodological constraints. First, we rely exclusively on Reddit as a single platform, which limits the generalizability of our findings. Reddit's user demographics skew heavily towards male, tech-savvy, and English-speaking users, which may not represent the broader movie-going audience. The platform's upvote/downvote mechanism creates echo chambers where popular opinions are amplified while dissenting views may be suppressed, potentially skewing our topic distribution analysis.

Additionally, Reddit's text-heavy format means we miss visual content that dominates other platforms; visual-heavy platforms like Instagram or TikTok might show different patterns, particularly for the "Cast" category where red carpet photos would drive more traffic. The high volume of Box Office posts may be partly driven by automated news bots, though our manual verification confirmed high user engagement in the comments of these threads.

Furthermore, Reddit's subreddit structure creates self-selection bias, as users actively choose which communities to participate in, meaning our sample may over-represent highly engaged fans rather than casual moviegoers.

Finally, we only had one annotator per post due to time constraints and project specifications, which could introduce subjectivity and reduce the reliability of our topic labels.

Future Directions

To address the stratified sampling bias that prevents understanding relative coverage, we could conduct parallel analyses: one with balanced sampling (as in this study) to understand discourse nature, and another with proportional sampling to understand discourse prevalence.

Future research could address these limitations through several avenues. Most critically, a multi-platform analysis incorporating Twitter/X, Instagram, TikTok, and YouTube would provide a more comprehensive view of social media discourse. However, since each platform has distinct demographic characteristics (e.g., TikTok skews younger, Facebook skews older), a sophisticated approach would involve first identifying the actual demographic profile of *Materialists* moviegoers through survey data or box office analytics. We could then collect data from multiple social media platforms, each with their own majority age demographic, and use weighted averaging to combine results. Platforms whose user demographics more closely match the movie's audience would receive higher weights in the final analysis, ensuring that the aggregated findings better represent the true discourse patterns among actual viewers rather than platform-specific user bases.

In future work, three annotators should annotate the whole 500 post dataset to strengthen the robustness of the coding scheme.
